

## Examples: Abstract Ideas

In this invention, as seen in Fig 1 reproduced below, a device profile is created based on information from a source device 2, such as a digital camera, and from a destination device 6, such as a printer. The device profile is used to produce the processed image signal 18 from the input image signal 16. Spatial characteristic information 12, 20 and color characteristic information 14, 22 are provided from each device to an image processor 4, along with the input image signal 16. This characteristic information is used to generate first data relating to color information content of the image and second data relating to spatial information content of the image using known mathematical techniques, such as Fourier analysis to yield a Wiener Noise Power Spectrum (mathematical processing techniques). The generated data is incorporated into the device profile.

### Representative Claim

10. A method of generating a device profile that describes properties of a device in a digital image reproduction system for capturing, transforming or rendering an image, said method comprising:

generating first data for describing a device dependent transformation of color information content of the image to a device independent color space through use of measured chromatic stimuli and device response characteristic functions;

generating second data for describing a device dependent transformation of spatial information content of the image in said device independent color space through use of spatial stimuli and device response characteristic functions; and

combining said first and second data into the device profile.

### Analysis

#### Claim 10: Ineligible.

The claim is directed to a statutory category, because it recites steps for generating data that satisfies the requirements of a process (a series of acts) (Step 1: YES).

Next, the claim is analyzed to determine whether it is directed to a judicial exception. The claim recites a method of generating first data and second data using mathematical techniques and combining the first and second data into a device profile. In other words, the claimed method simply describes the concept of gathering and combining data by reciting steps of organizing information through mathematical relationships. The gathering and combining merely employs mathematical relationships to manipulate existing information to generate additional information in the form of a 'device profile,' without limit to any use of the device profile. This idea is
